@vitalethomas

# About Me

## Thomas Vitale

- Senior Software Engineer at Systematic, Denmark.
- Spring, Cloud Native, DevOps, Kubernetes, Application Security.
- Author of “Cloud Native Spring in Action” (Manning).

# Cloud Native

[thomasvitale.com](https://thomasvitale.com)

[@vitalethomas](https://twitter.com/vitalethomas)

# Why Cloud Native?

## Speed

Faster and flexible delivery

## Scale

Elasticity and dynamic scaling

## Resilience

Availability and stability

## Cost

Efficiency and cost optimisation

# The Three P's of Cloud Native Applications

## Place

Private Cloud  
Public Cloud  
Hybrid Cloud

## Properties

Scalability  
Loose Coupling  
Resilience  
Manageability  
Observability  
Security

## Practices

Automation  
Continuous Delivery  
DevOps

# Cloud Native Development

## Development principles with Spring Boot

- **Self-contained application**
  - Embedded server
  - No external dependencies
  - JAR packaging (“fat-JAR”)
- **Externalized configuration**
  - Property files for default values
  - JVM system variables
  - Environment variables

# Containerization

[thomasvitale.com](https://thomasvitale.com)

[@vitalethomas](https://twitter.com/vitalethomas)

1

**Don't use fat JARs**

2

**Optimize build/runtime performance**

3

**Don't run as *root* or include secrets**

# Containerize Spring Boot Applications

Dockerfiles

[@vitalethomas](https://twitter.com/vitalethomas)

# Spring Boot on Kubernetes

## Kubernetes manifests for deploying applications

- **Deployment** -> deploy the application (with replicas)
- **Service** -> expose the application to the inside of the cluster
- **Ingress** -> expose the application to the Internet

# Deploying Spring Boot Applications

## Computational resource configuration

- **Requests** are the resources guaranteed to the application container.
- **Limits** define the maximum resources an application container can get.
- **CPU** is *compressible*.
  - When limit hit: throttle.
  - For JVM containers, no limit for startup boost.
- **Memory** is *non-compressible*.
  - When limit hit: OOMKilled
  - For JVM containers, same value for *requests* and *limits*.

# Externalized Configuration

[thomasvitale.com](https://thomasvitale.com)

[@vitalethomas](https://twitter.com/vitalethomas)

# Code, Configuration, Credentials

# ConfigMaps and Secrets

## Configuration and credentials

- **ConfigMaps**
  - Environment variables
  - Volume mounts
- **Secrets**
  - Environment variables
  - Consider a backend like Vault for actual encryption or Sealed Secrets

# Graceful Shutdown

[thomasvitale.com](https://thomasvitale.com)

[@vitalethomas](https://twitter.com/vitalethomas)

# Graceful shutdown

## Spring Boot and Kubernetes

- **Spring Boot**
  - Enable graceful shutdown
  - Define a grace period
- **Kubernetes**
  - Add pre-stop hook
  - Define a grace period

# Health Probes

[thomasvitale.com](https://thomasvitale.com)

[@vitalethomas](https://twitter.com/vitalethomas)

# Liveness and Readiness Probes

# Health Probes

## Liveness and readiness

- **Spring Boot**
  - Use Spring Boot Actuator
  - Liveness and readiness health endpoints are automatically exposed when Kubernetes is detected.
- **Kubernetes**
  - Configure liveness probe
  - Configure readiness probe

# Spring Native

[thomasvitale.com](https://thomasvitale.com)

[@vitalethomas](https://twitter.com/vitalethomas)

# Spring Native

## Native executables with GraalVM

- **Benefits**
  - Instant startup
  - Instant peak performance
  - Reduced memory consumption
- **Tradeoffs**
  - Slower and heavier build process
  - Fewer runtime optimizations

# GitOps - Cloud Native Operations

## GitOps Deployment Workflow

<https://www.weave.works/technologies/gitops/>

# GitOps - Configuration

```
helm upgrade -i flux fluxcd/flux \
--set git.user=$GITHUB_USER \
--set git.email=$GITHUB_USER@users.noreply.github.com \
--set git.url=git@github.com:$GITHUB_USER/spring-boot-
kubernetes-goto-2021 \
--set git.path="deployment" \
--set git.branch="main" \
--namespace flux
```

# Cloud Native Spring in Action

## With Spring Boot and Kubernetes

- 35% discount code, valid for all products in all format
